

GeoPense Computing Team

GeoPense is a world-wide volunteer computing effort, gathering computing resources to work on research in biology and physical sciences. This effort is geared towards institutional and governmental participants, but individuals are welcome to join.

The first two tasks taken on are protein folding and the search for gravitational waves from deep space.

Assistance is given freely to those participating. When set up properly, this computing power uses only dormant computer time, resulting in no adverse effect on the day-to-day operations of an institution. On-site assistance, mentoring, and presentations are all available upon request. In addition, active displays of project status can be set up, providing excellent public viewing of an institution's participation.

GeoPense is and always will be a completely non-commercial enterprise. Please contact us if you or your institution are interested in joining the team.
