

## GeoPense World Computing Team

GeoPense is a worldwide volunteer computing effort, gathering computing resources to work on research in biology, information science, physical science, and astronomy. This effort is geared towards institutional and governmental participants, but individuals are welcome to join.

The first tasks taken on range from protein folding to quantum computing to the search for gravitational waves from deep space.

Assistance is given freely to those participating. When set up properly, this computing power uses only dormant computer time, resulting in no adverse effect on the day-to-day operations of an institution. On-site assistance, mentoring, and presentations are all available upon request. In addition, active displays of project status can be set up, providing excellent public viewing of an institution's participation.

GeoPense is and always will be a completely non-commercial enterprise. Please explore further and/or contact us if you or your institution are interested in joining the team.
